$$y = z$$

$$z = y$$

They're all the same! But with complex joins, this is easier to see in pictures.

Relations with more than two “sides” (like this) are sometimes called

systems of equations.

But I find a single 3-sided relation more intuitive than a “system” of two equations.

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so.

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway,

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway, we don't even need a name for it.

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway, we don't even need a name for it.
- The meaning is still imprecise.

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway, we don't even need a name for it.
- The meaning is still imprecise. Even this is valid if x happens to be 0.

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway, we don't even need a name for it.
- The meaning is still imprecise. This diagram isn't just true for **some** x ...

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway, we don't even need a name for it.
- The meaning is still imprecise. This diagram isn't just true for **some** x ... it's true for **any** x that is a "real" number,

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway, we don't even need a name for it.
- The meaning is still imprecise. This diagram isn't just true for **some** x ... it's true for **any** x that is a "real" number, which we show like this.

Let's write "multiplication by 0.5 is the inverse of multiplication by 2."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway, we don't even need a name for it.
- The meaning is still imprecise. This diagram isn't just true for **some** x ... it's true for **any** x that is a "real" number, which we show like this.

Let's write " A^{-1} is the inverse of A over \mathbb{R} ."

- We can turn the bottom diagram around, like so.
- Of course, $x = x$ and $y = y$, so we can join those relations in.
- But we can remove redundant labels, like so. Since we're just going to transform y back into x anyway, we don't even need a name for it.
- The meaning is still imprecise. This diagram isn't just true for **some** x ... it's true for **any** x that is a "real" number, which we show like this.
